

solomon

MCP-native currency infrastructure for verified legal knowledge

THE PROBLEM

Search can find a useful memo but cannot establish whether its authority moved, a later view superseded it, or a lawyer contested it.

THE PRODUCT

Solomon records provenance, valid and ingestion time, dependencies, verification, supersession, contestability, and metadata-only audit evidence.

HOW IT FITS

An MCP host calls `preflight_context` before prompt assembly, then uses `why`, `impact`, or `audit_pack` when human review is required.

LIMITS

Solomon does not decide the law, monitor every authority, or replace firm deployment, retention, confidentiality, and professional-responsibility controls.

EVIDENCE PATH

1. Boundary-review firm knowledge.
2. Record or confirm dependencies.
3. Register authority or internal changes.
4. Propagate stale-pending-review state.
5. Reaffirm, supersede, retire, or contest.
6. Export a hash-verified audit pack.

REVIEW QUESTIONS

What is current? What changed? Which matters are affected? Who verified the position? What evidence supports reuse?
